Variables which have  $\geq 0.5$  correction with Saleprice

1. OverallQual (Overall material and finish quality)
2. YearBuilt (Original construction date)
3. YearRemodAdd (Remodel date)
4. TotalBsmtSF (Total square feet of basement area)
5. 1stFlrSF (First Floor square feet)
6. GrLivArea (Above grade (ground) living area square feet)
7. FullBath (Full bathrooms above grade)
8. TotRmsAbvGrd (Total rooms above grade (does not include bathrooms))
9. GarageCars (Size of the garage in car capacity)
10. GarageArea (Size of the garage in square feet)

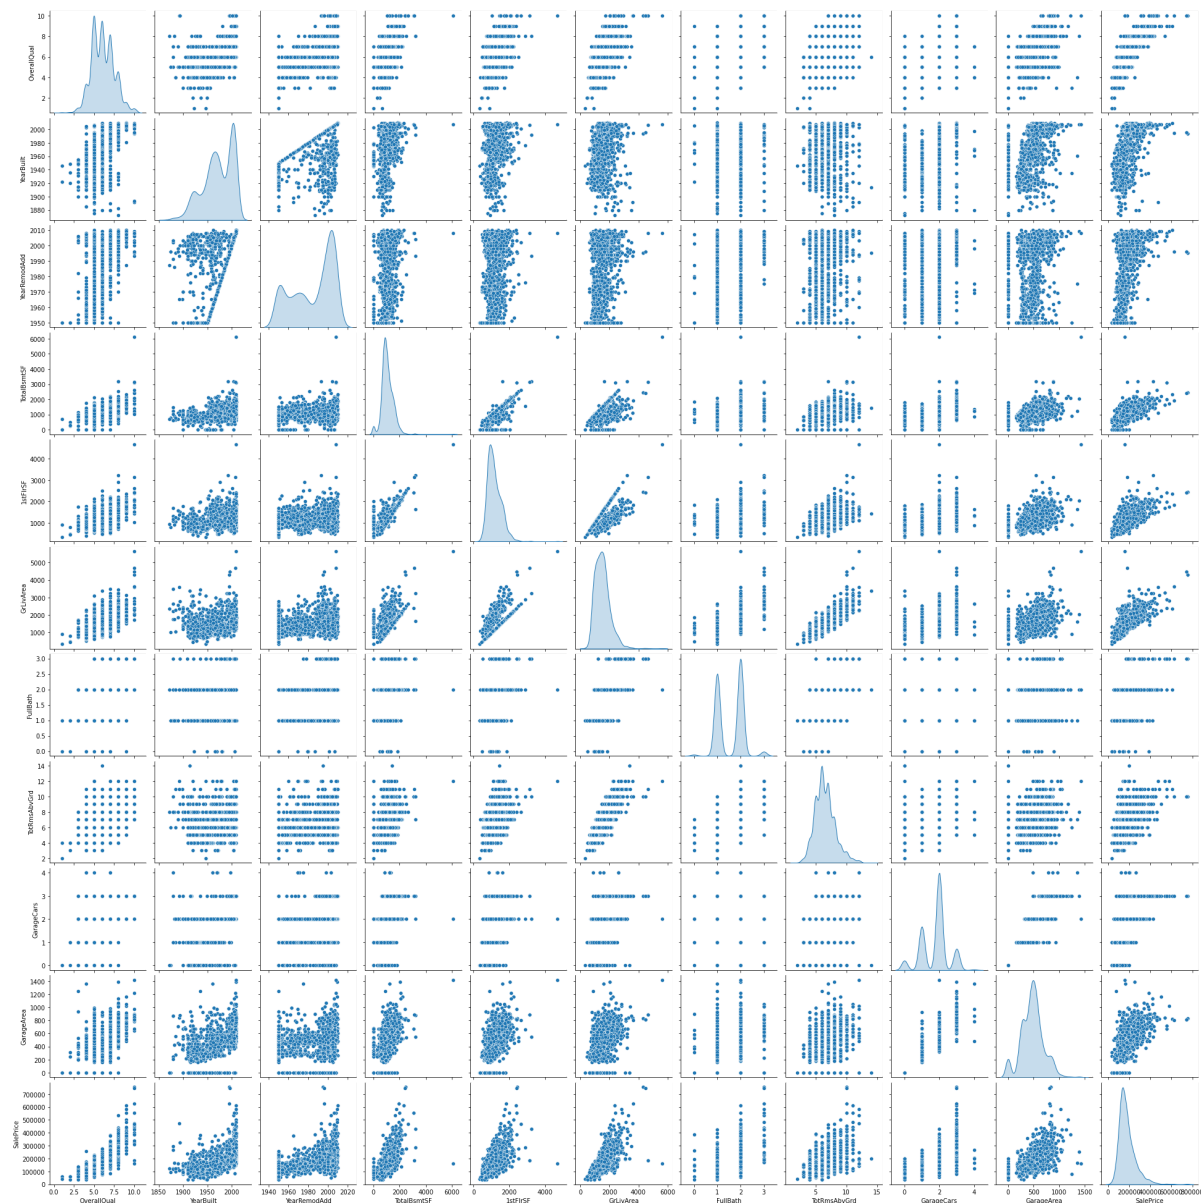

d. Pair plot for distribution and density

In [17]:

```
sns.pairplot(Data_numeric, vars=['OverallQual', 'YearBuilt', 'YearRemodAdd', 'TotalBsmtSF', '1stFlrSF', 'GrLivArea', 'FullBath', 'TotRmsAbvGrd', 'GarageCars', 'GarageArea', 'SalePrice'], diag_kind="kde")
```

Out[17]:

<seaborn.axisgrid.PairGrid at 0x7fbb6a7ac90>

As we can see in pairplot many variables match themselves

1. YearRemodAdd with SalePrice has a high resemblance to that of YearBuilt with SalePrice.
2. 1stFlrSF with SalePrice has a high resemblance to that of TotalBsmtSF with SalePrice.
3. TotRmsAbvGrd is highly correlated to GrLivArea.
4. GarageArea is highly correlated to GarageCars.

So, creating new numeric data which affect SalePrice

In [18]:

```
Data_numeric_new = Data_numeric[['OverallQual', 'YearBuilt', 'TotalBsmtSF', 'GrLivArea',  
'FullBath', 'GarageCars', 'SalePrice']]  
Data_numeric_new
```

As we can see the data with larger null value is not related to sale price we can drop them. So, we can drop Alley, PoolQC, Fence, MiscFeature and FireplaceQu

In [20]:

```
